

Digital Voting System — End-to-end Voter Flow

Clear, secure steps that guide a voter from sign-in to a confirmed ballot — designed for usability, accessibility, and election integrity.

At-a-glance: 8-step voter journey

- Step 1 — Enter candidate name (search)
- Step 2 — Enter mobile number
- Step 3 — OTP verification
- Step 4 — Voter ID verification
- Step 5 — Face verification
- Step 6 — Select candidate
- Step 7 — Submit vote
- Step 8 — Confirmation

Step 1 — Candidate Name (Search)

Simple, type-to-search field with autocomplete. Promotes accessibility with large touch targets and voice input option. Protects against spoofed entries by linking names to unique candidate IDs in the backend.

- Design tip: show candidate photos and party color chips to reduce selection errors.

Step 2 — Mobile Number

Collect a verified phone number as the primary authentication channel. Use immediate input validation (format, country code). Display privacy note: number used only for verification and not stored with ballot choices.

-  Suggested: mask stored number (***-**-1234) and allow alternate verification methods where required by law.

Step 3 — OTP verification ensures possession of the claimed mobile. Allow for timed OTP, resilient resend, and rate limiting to prevent abuse.

Step 4 — Voter ID Verification

Capture and validate a government-issued Voter ID using OCR and checksum checks. Provide real-time guidance (positioning, lighting) and fallback options (manual data entry with human review) to maximize accessibility.

- Automated match against voter rolls
- Immediate success/failure feedback
- Audit trail: hashed document reference (not raw image)

Step 5 — Face Verification

Use live selfie capture with liveness detection to confirm the voter matches official ID. Keep processing local where possible; store only a privacy-preserving template. Allow assistive workflows for those who cannot use face verification (e.g., accessibility hotline).

Privacy: always disclose what is stored, retention period, and how templates are protected.

Step 6 — Select Candidate

Present candidates with name, photo, and a short description. Use clear selection controls and a review screen. Include accessibility features: screen-reader labels, adjustable text size, and contrast-compliant colors.

Candidate 1

Tap to view platform details.

Candidate 2

Tap to view platform details.

Candidate 3

Tap to view platform details.

Step 7 — Submit Vote

Large, clearly labeled Vote button with a mandatory confirmation modal showing the selected candidate and an accessibility-optimized summary. Offer an undo window before final cryptographic sealing of the ballot.

- Confirmation dialog with candidate summary
- Finalize → ballot encrypted and signed on device
- Receipt: transaction ID and human-readable confirmation

Step 8 — Vote Submitted & Confirmation

Show a concise success screen with: transaction ID, summary of selections, and guidance on next steps (how to report issues). Provide options to download or screenshot a receipt, and a secure lookup for administrators to verify submission status without exposing ballot contents.

- ✔ Key assurance: end-to-end cryptographic proof ensures vote integrity while preserving voter anonymity.
